

A deep-sea octopus with a reddish-purple hue is the central focus, resting on a diverse coral reef. The octopus's large, suckered tentacles are visible on the left. The surrounding coral includes various species, such as a large, porous yellowish-white coral in the foreground and a more delicate, branching coral to the right. The background is dark, suggesting the deep-sea environment.

Deep Sea Corals in the
World's Largest Underwater
Canyons:

Will New Data Lead to New
Conservation Measures in
the Bering Sea?

Bering Sea

Zhemchug Canyon

Pribilof Canyon

Gulf of Alaska

• "...the Council adopts the SSC's recommendation to gather more information on the Bering Sea Slope canyons and suggests this be named a top priority for NPRB research."

Coral Provisions in MSA

- Locate, map, and reduce impacts to corals
- Report to Congress on steps taken to identify, monitor, and protect deep sea coral areas

NOAA Strategic Plan for Deep-Sea Coral and Sponge Ecosystems: Conservation and Management Objectives

- Protect areas containing known deep-sea coral or sponge communities from impacts of bottom-tending fishing gear.
- Develop regional approaches to further reduce interactions between fishing gear and deep-sea corals and sponges.
- Assess and encourage avoidance or mitigation of adverse impacts of non-fishing activities on deep-sea coral and sponge ecosystems.
- Provide outreach and coordinated communications to enhance public understanding of these ecosystems.

NOAA's Report to Congress on the Implementation of the Deep Sea Coral Research and Technology Program

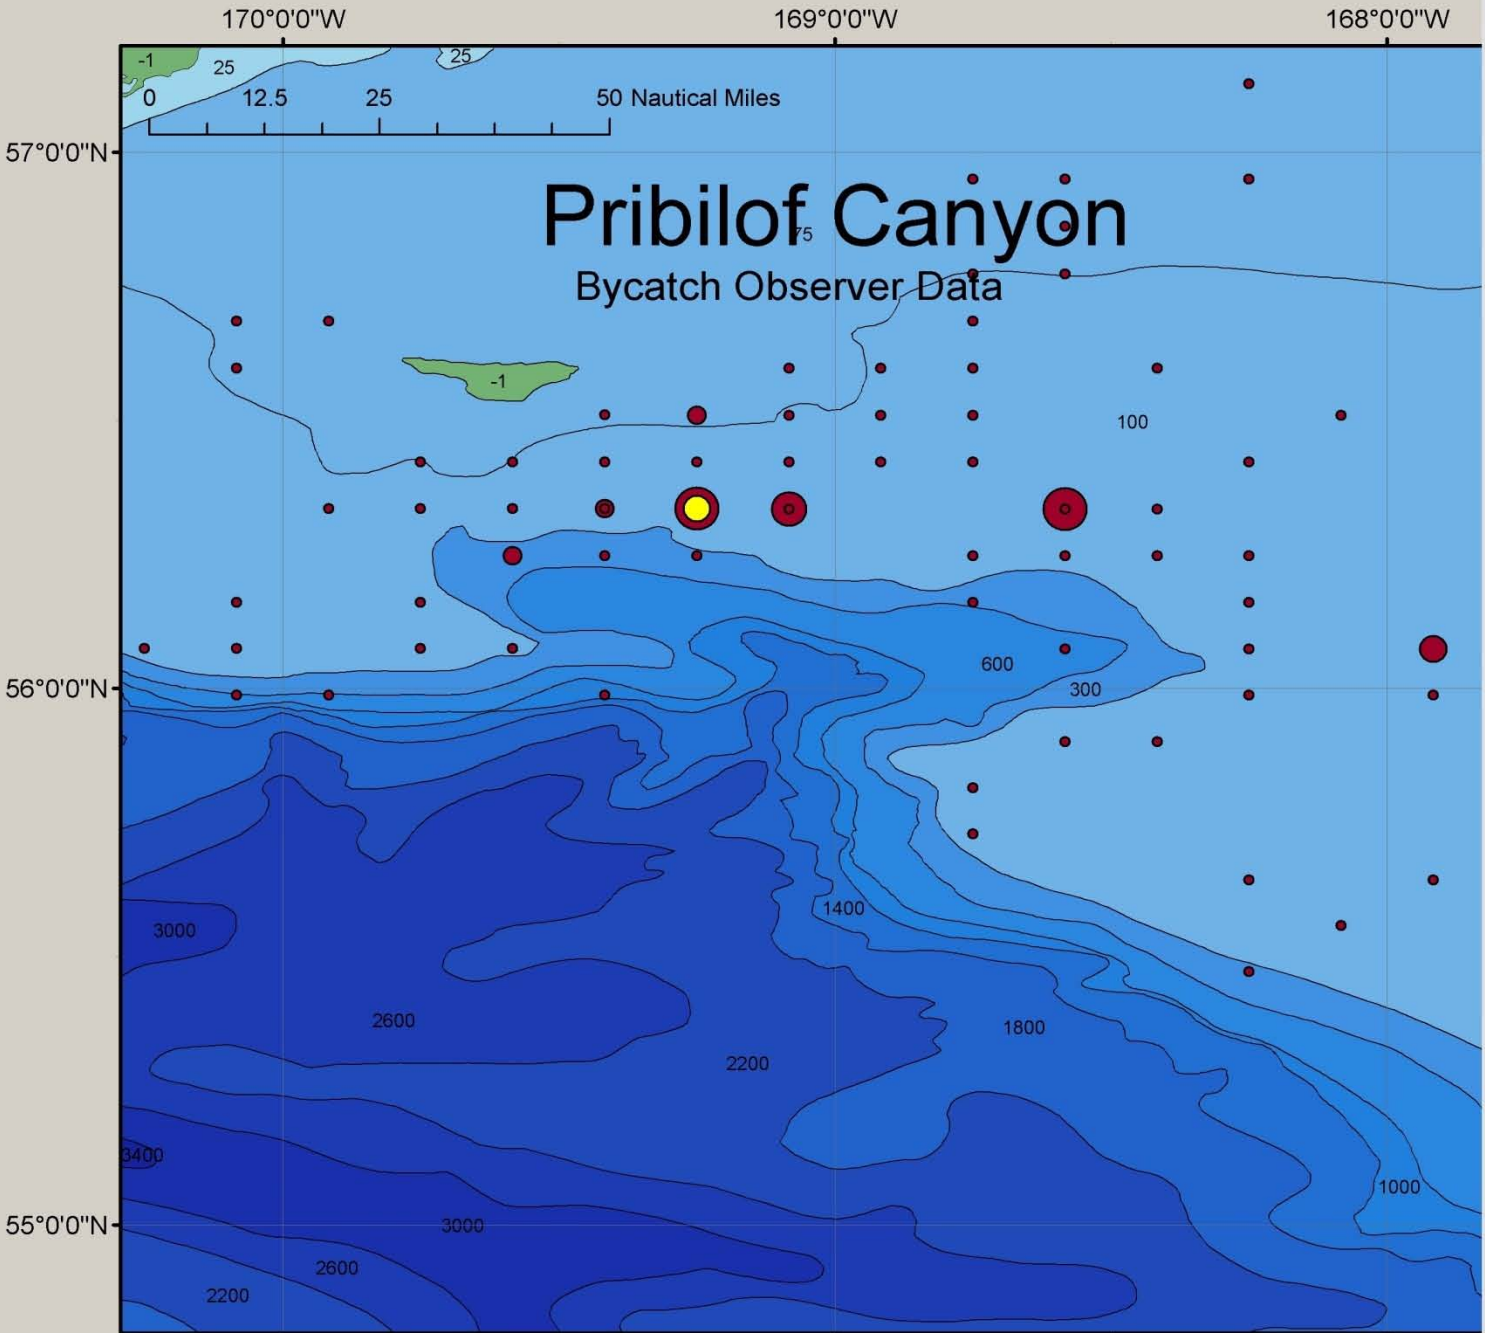

"The shelf break and upper slope, including areas of Pribilof and Zhemchug Canyons, contain areas of deep sea corals that currently have no special protections."

Knowledge to Date

- NOAA whitepaper
- Observer bycatch data
- NGO proposals and testimony
- NOAA Pribilof Canyon ROV study
- NOAA survey of Zhemchug Ridges
- NOAA trawl and longline surveys
- Sea bird & marine mammal forage data

GREENPEACE

Observer data: Alaska Fisheries Science Center

Bathymetry Data: National Ocean Service

Goals

1) Coral and sponge abundance (and diversity)

2) Associations of fishes with corals and other habitat structure

3) Document fishing impacts

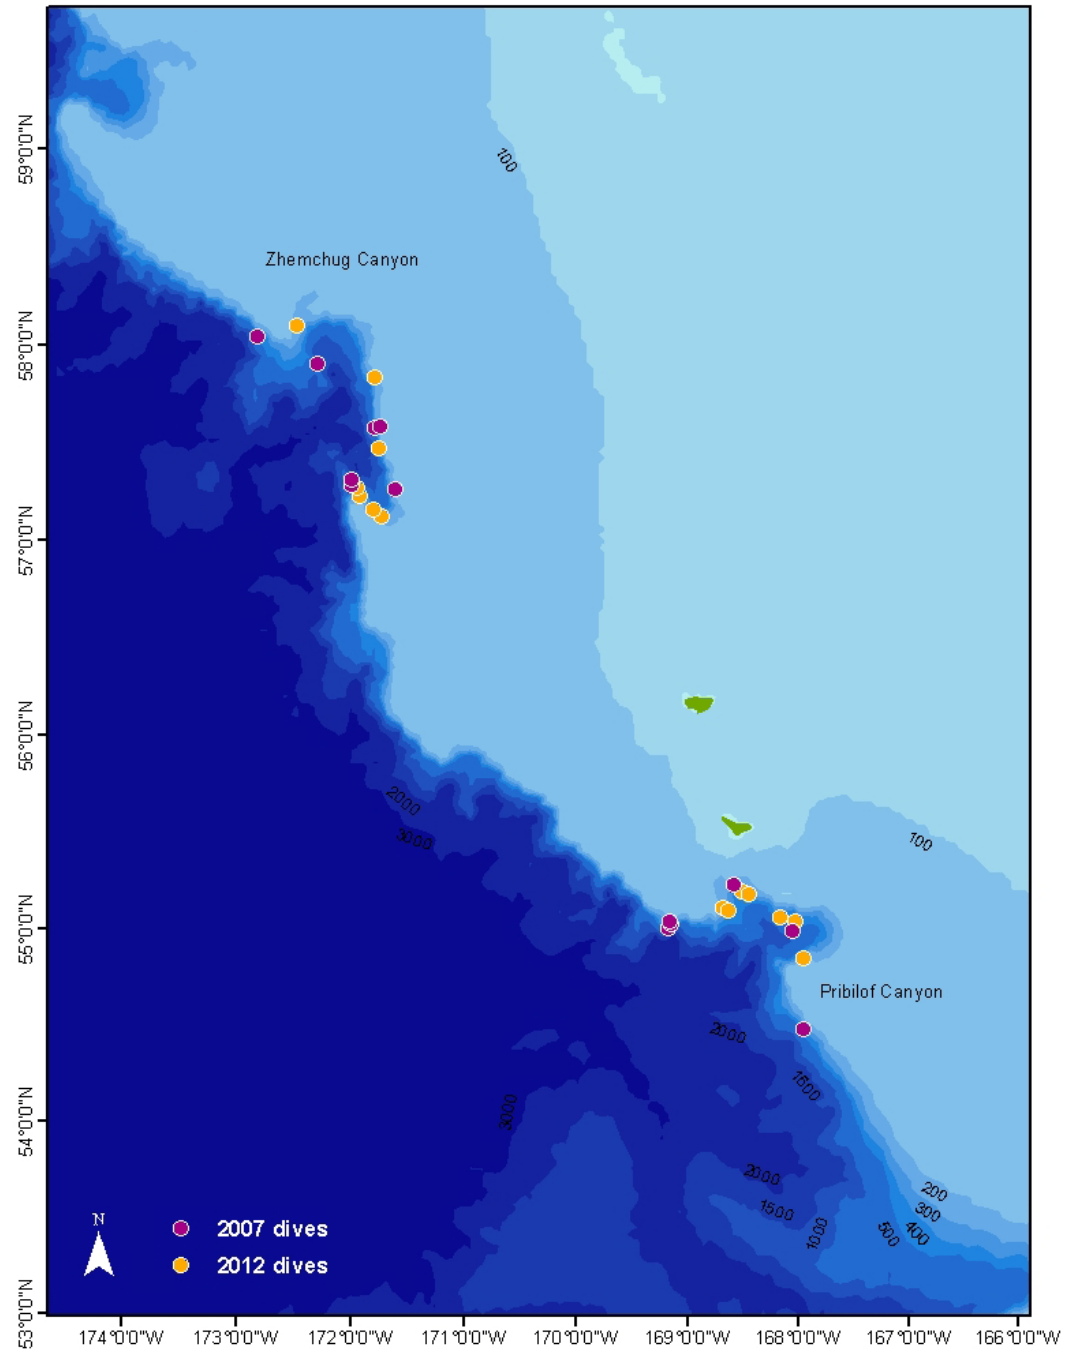

DeepWorker Submersibles

- 100-550m depth
- Upslope at constant heading
- Video camera at 30° from horizontal at widest zoom
- Paired scaling lasers
- 7,209 frames, ~30,000 m sq.

Transect locations from 2007 (purple) and 2012 (orange)

Zhemchug Canyon
Aleutians (Stone 2006)
Weddell Sea (Orejas et al. 2002)
Norway (Mortensen et al. 1995)
Atlantic Canada (Mortensen and Mortensen 2004)

Total sponge abundance

Pribilof Canyon
Zhemchug Canyon
Gulf of Alaska (Freese et al 1999)
Porcupine Seabight
(Rice et al 1990)
California (Beaulieu et al. 2001)

Depth distribution of corals and sponges

Habitat associations

Logistic regression

Dependent (habitat) variables:

- Depth
- Boulders
- Gorgonian corals
- Pennatulacean corals
- Sponges

Null hypothesis: Fish A is no more likely to occur in a frame in which corals are present than one in which corals are absent.

Intrinsic value of corals – Auster (2005)

- Long-lived (100's-1000's of years)
- Sensitive to disturbance
- Recover slowly

Auster PJ (2005) Are deep-water corals important habitats for fishes? In: Freiwald A, Roberts JM, editors. Cold-water Corals and Ecosystems. Berlin Heidelberg: Springer-Verlag. pp. 747-760.

Fishing disturbance

2007 - 13 observations

2012 - 79 observations

2007- 0.26% of video frames analyzed = 28.8 m²

2012- 1.77% of video frames analyzed = 364.4 m²

Trawl data from Hoff 2010

No Existing Protections for Bering Sea Shelf Break/Slope Canyons

- Commercially important
- Biologically productive
- Marine mammal / seabird foraging areas
- Vulnerable seafloor habitats
- Nursery areas
- Unidentified species
- Deepwater refuges
- Cultural significance

Benefits of Marine Reserves

- Increase abundance, average size, reproductive output and genetic diversity
- Enhance fishery yield in adjacent areas
- Provide simple and cost-effective management regime
- Guard against uncertainty and reduce probability of overfishing and fishery collapse
- Protect endangered species and marine mammals
- Provide basis for ecosystem-based management
- Increase habitat quality, species diversity and community stability
- Provide experimental control sites for monitoring and assessing relative impacts of fishing and climate change
- Improve public awareness, education and understanding

Thank you!
